

Assignment:

1. Which of the following is a valid variable name in Python?

- a) 2var
- b) my-var
- c) _myVar
- d) my var

2. What is the data type of $x = 3 + 4j$?

- a) int
- b) float
- c) complex
- d) str

3. `type(True)` returns:

- a) `<class 'bool'>`
- b) `<class 'int'>`
- c) `<class 'str'>`
- d) `<class 'float'>`

4. What will `bool([])` return?

- a) True
- b) False
- c) Error
- d) None

5. Which function is used to find the data type of a variable?

- a) `datatype()`
- b) `typeof()`
- c) `type()`
- d) `gettype()`

6. What is the output of `print(type(10 / 2))`?

- a) `<class 'int'>`
- b) `<class 'float'>`
- c) `<class 'complex'>`
- d) `<class 'str'>`

7. Which of the following is NOT a Python numeric type?

- a) int
- b) double
- c) float
- d) complex

8. What will be the output?

`a = 10`

```
b = a
a = 20
print(b)
```

- a) 10
- b) 20
- c) None
- d) Error

9. Which data type can store a collection of unique elements?

- a) list
- b) tuple
- c) set
- d) dict

10. What is the output of `print(isinstance(5.0, int))`?

- a) True
- b) False
- c) Error
- d) None

11. Which of the following are invalid identifiers in Python?

- a) Total-sum
- b) Error
- c) Error_count
- d) None of these

12. A _____ is a sequence of one or more characters used to provide a name for a given program element.

- a) Identifier
- b) Variable
- c) String
- d) Character

13. Identify the invalid identifier below.

- a) `_2017discount`
- b) `Profit`
- c) `Total-discount`
- d) `Totaldiscount`

14. _____ are not allowed as part of an identifier.

- a) Spaces
- b) Numbers
- c) Underscore
- d) All of these

15. Identifiers may contain letters and digits, but cannot begin with a _____.

- a) Character
- b) Digit
- c) Underscore
- d) Special Symbols

16. Which is not a reserved keyword in Python?

- a) insert
- b) except
- c) import
- d) yield

17. Identify the invalid keyword below.

- a) and
- b) as
- c) while
- d) until

18. _____ is an identifier that has predefined meaning.

- a) variable
- b) identifier
- c) keyword
- d) None of these

19. Guess the output of the following code.

`1 > 2 and 9 > 6`

- a) True
- b) False
- c) Machine Dependent
- d) Error

20. The expression that results in an error is _____.

- a) `int('10.8')`
- b) `float(10)`
- c) `int(10)`
- d) `float(10.8)`

21. Which of the following expression is an example of type conversion?

- a) `4.0 + float(3)`
- b) `5.3 + 6.3`
- c) `5.0 + 3`
- d) `3 + 7`

22. What is the output when the following statement is executed?

`>>>print('new' 'line')`

- a) Error
- b) Output equivalent to print 'new\nline'

- c) new line
- d) newline

23. What is the output when the following statement is executed?

```
print(0xD + 0xE + 0xF)
```

- a) Error
- b) 0XD0XE0XF
- c) 0X22
- d) 42

24. What is the output of `print (0.1 + 0.2 == 0.3)`?

- a) True
- b) False
- c) Error
- d) Machine dependent

25.

```
x = 5
```

```
y = 2.5
```

```
print(x + y)
```

26.

```
a = "10"
```

```
b = 5
```

```
print(a * b)
```

27.

```
num = 7
```

```
num = "seven"
```

```
print(num, type(num))
```

28.

```
result = bool("False")
```

```
print(result)
```

29. Given the below code snippet, which of the following options would create a variable called `final_string` that is assigned to the word "yelling"?

```
string1 = "yellow"
```

```
string2 = "screaming"
```

- A. `final_string = string1[:4] + string2[-3:]`
- B. `final_string = string1[:4] + string2[6:]`
- C. `final_string = string1[:3] + string2[6:]`
- D. `final_string = string1[:3] + string2[6:-1]`

E. `final_string = string1[:4].append(string2[-3:])`

30. Which of the following choices correctly prints a sentence using the variable `num_of_apples`?

`num_of_apples = 4`

- A. `print("I have " + num_of_apples + " apples.")`
- B. `print("I have " + str("num_of_apples") + " apples.")`
- C. `print("I have 4 apples.")`
- D. `print("I have " + str(num_of_apples) + " apples.")`

31. Which of the following are string methods?

- A. `split()`
- B. `lower()`
- C. `append()`
- D. `startswith()`
- E. `sort()`

32. Which of the following code corresponds to the amount of characters in the following string variable?

`string = "I love coding!"`

- A. `count(string)`
- B. `len(string)`
- C. `int(string)`
- D. `length(string)`

33. What does the following code output?

```
def abbrev(first_name, last_name):  
    print(first_name[0:1] + ". " + last_name.lower())
```

`abbrev("Joanne", "Weathers")`

- A. J. Weathers
- B. Jo. Weathers
- C. oa. Weathers
- D. J. weathers
- E. j. weathers

34. After running this code, what would be the output if the input was `first_name = "Katie"` and `last_name = "perkins"`?

```
def abbrev():
    first_name = input("What is your first name? ")
    last_name = input("What is your last name? ")
    return("Hello " + first_name + last_name[0:2].capitalize() + ". ")
```

```
def main():
    abbrev()
```

```
main()
```

- A. Hello KatiePe.
- B. Nothing.
- C. Hello Katie Pe.
- D. Hello KatiePE.

35. Given the variable item, how would you grab the letters “tebo”?

```
def notebook():
    item = "notebook"
    # What goes here?
```

```
notebook()
```

- A. print(item[2:7])
- B. print(item[2:6])
- C. print(item[-6:-2])
- D. print(item[3] + item[4] + item[5] + item[6])
- E. print(item[3:7])

36. Write code to generate following output:

x = 10

y = 5

Output:

Addition: 15

Multiplication: 50

Division with 2 decimal places: 2.00

37. Write code to generate following output:

```
# Controlling decimal places
```

```
pi = 3.14159
```

```
price = 19.99999
```

percentage = 0.8525

Output

Pi to 2 decimal places: 3.14

Price rounded to 2 decimals: 20.00

Percentage with 1 decimal: 85.2%
